Just as a book written by Mary Carey.As is known in the art, a typical fuel injection system is

comprised of an intake manifold which is positioned on a vehicle's intake manifold. The intake manifold is in communication with a suction port of the engine. In a typical combustion process, fuel is injected at the suction port of the engine via a fuel injector. The fuel injector mixes the fuel with air at the suction port of the engine so that a combustible mixture is formed. The combustible mixture then enters a cylinder of the engine where it is combusted. With reference to FIG. 1, in a typical fuel injection system, an electronic control module (ECM) 102 is in communication with a plurality of fuel injectors 112. The ECM 102 is also in communication with a fuel rail 106. The fuel rail 106 is disposed around the suction port of the engine. The ECM 102 controls an amount of fuel injected by each of the fuel injectors 112 via a plurality of electromagnetically operated fuel injector valves 110. Typically, the amount of fuel is adjusted to control combustion of the combustible mixture. If the ECM 102 is

malfunctioning, one or more of the fuel injectors 112 may be inoperative. When that occurs, the engine may fail to combust a combustible mixture. The conventional system has a number of disadvantages. For example, current systems lack means
